

Effect of Various Kinds of Dietary Proteins In Semi – Artificial Diets on the Mulberry Silkworm *Bombyx mori* L.

Mona M. Mahmoud

Dep. of Sericulture, Plant Protection Res. Institute, ARC, Alexandria, Egypt.

ABSTRACT

Larvae of *Bombyx mori* were reared on various kinds of dietary protein (soybean, mushroom and mixture of them) using semi-artificial diet. Larvae fed on semi-artificial diet containing soybean all over the 5th instar larvae gave the highest records on the larval duration, weights of larvae, silk gland, pupa, cocoon and cocoon shell, as well as number of deposited eggs. The same diet gave the lowest mortality percentages. The lower weights were calculated from larvae fed on mushroom diet. Insignificant differences were recorded on the pupal stage duration. Same trend of results were indicated for the larvae fed on the same materials till the 5th day of the last instars then fed on natural diet.

INTRODUCTION

Mulberry is the primary host plant of silkworm *Bombyx mori* L. which is exploited on commercial scale for production of silk. The aim of the sericulturist is to improve the production of silk quantitatively and qualitatively.

Silkworm is a highly sensitive insect and responds sharply to changes in the feed quality. The effects of various kinds of dietary protein on growth of the silkworm *Bombyx mori* L. were determined using semi-synthetic diets. Ito and Inokuchi, (1981) and Horie and Watanabe, (1983) found that larval growth was largely dependent on the dietary proteins.

In (1960) Fukuda *et al.*, succeeded to rear silkworm *Bombyx mori* on artificial diet for a long time. Akhtar and Asghar, (1972) used casein or its component amino acids mixture as a source of protein in the semi-synthetic diet for silkworm *Bombyx mori* larvae. Horie and Watanabe (1983) found that the increase in the body weight of the silkworm larvae and fresh silk glands were largest in the larvae fed on soybean meal diet. Moustafa *et al* (1997) studied the nutritional effect of tested level of mulberry leaf powder and dietary soybean in the semi-artificial diet. El-Sayed (1999) and El-Hattab (2002) studied the evaluation of various kinds of proteins in semi-artificial diets of *Bombyx mori* larvae on some bio-physiological parameters.

The objective of the present work is to study the effect of two sources of protein (soybean and mushroom) and their mixture in semi-artificial diet on some biological parameters and the productivity of the silkworm *Bombyx mori* L.

MATERIALS AND METHODS

The tested dietary proteins used in this study were as follows:

- 1- Soybean meal powder (Table, 1).
- 2- Oyster mushroom powder instead of soybean powder.
- 3- 5 g. of soybean powder + 5 g. of oyster mushroom powder.

The eggs of mulberry silkworm *Bombyx mori* L. were reared in the laboratory according to the standard rearing technique as advocated by Krishnaswami (1973)

under the hygrothermic conditions of 26 ± 1.5 °c and 75 ± 5 % R.H. The larvae were fed on fresh clean mulberry leaves variety Romi until 4th instar. Only the last larval instar was used in the experiment. The larvae were grouped, since the first group was fed by the various tested dietary proteins in semi-artificial diet all over the fifth larval instar. The second group was fed on the same materials till the fifth day of the last instar then fed on the natural diet. The basic dietary ingredients chosen in this work were those used by Fukuda (1963), Salem (1974) and El-Hattab (1985) in Table 1.

Table (1): component of the basic semi-artificial diet.

Constituents	(g.)
Dried powder of mulberry leaves	55
Sugar	10
Soybean meal powder	10
Agar-agar powder	15
Sodium dihydro acetic acid	0.54
Water	270 ml.

Nutritional Value of materials used:

a. Soybean powder:

In Table 2 according to USDA every (100 g.) soybean powder contains:

Table (2): Approximate Nutritional Value for (100 g.) Soybean Powder.

Calories	446 kcal
Protein	36.49 %
Fat	19.94 g.
Vitamin B2 (Riboflavin)	0.377 mg.
Vitamin C	6 mg.
Vitamin K	47 µg.
Fiber	9.3 g.
Carbohydrate	30.16 g.
Phosphorus	704 mg.
Calcium	277 mg.
Iron	15.7 mg.

b. Oyster mushroom powder:

In Table 3 according to County Line Mushrooms every (100g.) mushroom powder contains:

Table 3: Approximate Nutritional Value for (100g.) Oyster Mushrooms Powder.

Calories	38 kcal.
Protein	15-25%
Fat	2.2 g.
Vitamin B1 (Thiamine)	0.56 mg.
Vitamin B2 (Riboflavin)	0.55 mg.
Vitamin B3 (Niacin)	12.2 mg.
Fiber	2.8 g.
Carbohydrate	6.5 g.
Phosphorus	140 mg.
Calcium	28 mg.
Iron	1.7 mg.

Estimation of the studied parameters:

The experiment was designed on the basis of three replicates for each treatment. Each replicate contained 50 newly ecdised 5th instar larvae. The different

prepared diets were offered to the tested larvae in the form of slices. The durations of larvae and pupae were recorded, and the percentage of larval mortality was calculated.

The fresh weights of silk glands, pupae, cocoons and cocoon shells were determined. The number of deposited eggs/female moth were counted and recorded. Statistical analysis of data was performed on the basis of the mean values plus or minus standard deviation. Data were statistically analyzed and compared using "F" test, Least Significant Difference (L.S.D.) at 5% probability level, (Sendecor, 1956) and "T" test.

RESULTS AND DISCUSSION

Effect of the tested materials on biological parameters of the silkworm *Bombyx mori* L.:

The results presented in Table 4, show that the mean weights of the mature larvae, silk gland and pupa were significantly different. It is found that larvae fed on diet containing soybean (S) gave the heaviest weights of larvae, silk gland and pupa (3.49, 0.425 and 1.054 g. respectively). On the other hand the lightest weights (2.822, 0.301 and 0.875 g. in respect) were indicated by the diet containing mushroom powder (M).

Table 4, shows that the shortest duration of the fifth larval instar and larval duration were (10 and 33 days respectively) and that was recorded for those larvae fed on (M) diet, followed by, larvae fed on (S) diet and their mixture.

As shown in Table, 4 the duration of pupal stage for all tested materials were about 14 days.

Table 4: Effect of tested materials in semi-artificial diet on the inspected biological parameters of *Bombyx mori* L.

Treatments	Weight of larvae (g.) A	5 th instar duration (days)	Larval duration (days)	Weight of silk gland (g.) B	Weight of pupa (g.) A	Pupal duration (days)
S	3.490 a ± 0.279	11	34	0.425 a ± 0.072	1.054 a ± 0.072	14
M	2.822 c ± 0.126	10	33	0.301 b ± 0.018	0.875 c ± 0.083	14
S + M	3.193 b ± 0.155	11	34	0.353 b ± 0.012	1.003 b ± 0.092	14
L.S.D.	0.18	--	--	0.06	0.0027	--

• S = Soybean M = Mushroom S+M = mixture

• Each value represents the mean \pm S.D. of A = 10, B = 5 replicates.

• Means followed by same letter(s) are not significantly different.

Effect of tested materials followed by mulberry leaves on the biological parameters of the silkworm *Bombyx mori* L.:

The demonstrated results in Table 5, proved a significant difference in the mean weight of mature larvae. Larvae fed on mixture of (S+M*) diet, also, (S*) diet gave the heaviest mean weight (2.834 and 2.807 g. respectively).

The fresh weights of silk glands as well as pupal weights exhibited a same trend of results, where the (S*) diet gave the heaviest weight (0.551 and 0.950 g. in respect). Insignificant difference was recorded with the mixture (S+M*). While, the (M*) diet gave the lightest weight of (0.449 and 0.842 g. respectively).

As shown in Table, 5 the shortest fifth instar and larval durations (10 and 33 days in respect) were obtained when larvae fed on (M*) and (S+M*) diet.

In agreement with, Horie and Watanabe (1983) who reported that larval growth in *Bombyx mori* was largely dependent on the dietary protein, the increase in body and fresh silk gland weights reached their maximum on diet containing soybean. El-Hattab (2002) also, indicated that the fifth larval instar fed on diet contained palm date pollen grains + soybean meal gave the highest significant weights of larvae, silk glands and pupae.

Table 5: Effect of tested materials in semi-artificial followed by natural diet on the inspected biological parameters of *Bombyx mori* L.

Treatments	Weight of larvae (g.) A	5 th instar duration (days)	Larval duration (days)	Weight of silk gland (g.) B	Weight of pupa (g.) A	Pupal duration (days)
S*	2.807 a ±0.283	11	34	0.531 a ±0.082	0.950 a ±0.113	14
M*	2.643 b ±0.258	10	33	0.463 b ±0.085	0.842 b ±0.099	14
S + M*	2.834 a ±0.294	10	33	0.482 a ±0.082	0.888 ab ±0.113	14
L.S.D.	0.032	--	--	0.097	0.099	--

• S = Soybean M = Mushroom S+M = mixture

• * = larvae fed on semi-artificial diet followed by natural diet.

• Each value represents the mean ± S.D. of A = 10, B = 5 replicates.

• Means followed by same letter(s) are not significantly different.

These results are also in agreement with El-Sayed *et al* (1993) and El-Hattab (2002) who reported that the different source of protein affects the periods of larval and pupal durations.

Effect of the tested materials on silk and egg production of *Bombyx mori* L.

Significant differences between the mean weights of cocoons and fresh cocoon shells were observed (Table 6). The 5th larval instar fed on (S) and mixture (S+M) diet showed insignificant difference in the averages fresh cocoon and cocoon shell weights. While, the (M) diet gave the lightest weights of (1.006 and 0.13 g.) in respect.

Table 6: Effect of tested materials in semi-artificial diet on silk and production of silkworm *Bombyx mori*

Treatments	Weight of cocoon (g.) A	Weight of cocoon shell (g.) A	No. of deposited eggs B	Mortality %
S	1.26 a ±0.032	0.206 a ±0.023	391 a ±53.254	6
M	1.006 b ±0.081	0.130 b ±0.026	272.6 b ±23.723	8
S + M	1.237 a ±0.088	0.234 a ±0.041	315 b ±39.140	8
L.S.D.	0.075	0.029	55.87	--

• S = Soybean M = Mushroom S+M = mixture

• Each value represents the mean ± S.D. of A = 10, B = 5 replicates.

• Means followed by same letter(s) are not significantly different.

As shown in Table 6, the utmost increase rate of deposited eggs (391 eggs/female) was counted for the treatment of (S) diet. The (M) meal diet was always the least effective one.

A mortality of (8 %) was found for the diets of (M) and the mixture (S+M) (Table 6).

Effect of the tested materials followed by mulberry leaves on silk and egg production of *Bombyx mori* L.

The same trend of results were also revealed for the tested materials of soybean (S*), mushroom (M*) and mixture (S+M*) diets followed by natural diet. As shown in Table 7, the measured weights of fresh cocoon were the heaviest in the larvae fed on (S*) diet (1.166 g.) while, lightest weights (1.03 g.) were given to (M*) diet.

No significant differences were considered between tested materials in the weights of cocoon shell.

Highest numbers of deposited eggs per female moths were obtained from the treatments of larvae fed on (S*) and mixture of (S+M*) diets (380 and 335.6 eggs/female respectively). Table 7, also show a mortality of (6%) in the (M*) diet.

These results are in accordance with those reported by Horie *et al* (1971) and El-Hattab (2002) that the elevation of dietary protein resulted in the acceleration of growth and silk production. Also, El-Hattab (1985); El-Karaksy *et al* (1989); El-Sayed (1993); Moustafa *et al* (1997); El-Sayed (1999) and El-Hattab (2002) proved that the type of protein source material in the semi-artificial diet, affected the weights of cocoon, cocoon shells and number of deposited eggs.

Table 7: Effect of tested materials in semi-artificial diet followed by natural diet on silk and egg production of silkworm *Bombyx mori* L.

Treatments	Weight of cocoon (g.) A	Weight of cocoon shell (g.) A	No. of deposited eggs B	Mortality %
S*	1.166 a ± 0.086	0.206 ± 0.023	380 a ± 56.124	5
M*	1.03 b ± 0.132	0.187 b ± 0.068	312.8 b ± 22.620	6
S + M*	1.078 ab ± 0.119	0.189 ± 0.061	335.6 a ± 24.835	5
L.S.D.	0.104	0.055	52.04	--

1. S = Soybean M = Mushroom S+M = mixture

2. * = larvae fed on semi-artificial diet followed by natural diet.

3. Each value represents the mean \pm S.D. of A = 10, B = 5 replicates.

4. Means followed by same letter(s) are not significantly different.

ARABIC SUMMARY

تأثير بعض أنواع البروتينات في بيئة نصف صناعية على إنتاجية ديدان الحرير التوتية

منى ماهر محمود

معهد بحوث وقاية النباتات – مركز البحوث الزراعية – الإسكندرية – مصر

يهدف هذا البحث دراسة تأثير أضافة بعض أنواع البروتينات (فول الصويا، المشروم و خلائطهما) في بيئة نصف صناعية بتركيزات مختلفة لنقييم بعض القیاسات البيولوجية و الإنتاجية ليرقات ديدان الحرير التوتية. وقد أدت تغذية اليرقات طوال العمر الخامس ببيئة نصف صناعية محتوية على فول الصويا إلى زيادة طول العمر اليرقى و وزن اليرقات، غدة الحرير، الغذاء، الشرنقة و غلاف الشرنقة بالإضافة لعدد البيض الموضع معنوياً بالمقارنة بالمعاملات الأخرى المختبرة. بينما اقل النتائج حصلت عليها اليرقات التي تغذت على بيئة نصف صناعية محتوية على المشروم. لم يكن هناك فروق معنوية بين جميع المعاملات في طول العمر العذري. نفس اتجاه النتائج تم الحصول عليها عند تغذية اليرقات حتى اليوم الخامس من العمر اليرقى الاخير و التكملة بغذاء طبيعي حتى التسلق.
